First Name:			
Section normally attended (Circle one):	L0101/L2001(1pm)	L0201/L2003 (3pm)	L5101/L2501(6pm)

Do **not** turn this page until you have received the signal to start. In the meantime, please fill out the identification section above, and read the instructions below.

This test consists of 4 questions on 9 pages (including this one). When you receive the signal to start, please make sure that your copy of the test is complete.

If you use any space for rough work or need to scratch out an answer, circle the part that you want us to mark.

You may write in pencil, however, work written in pencil will not be considered for remarking.

Good Luck!

Question 1. [12 MARKS]

Consider this schema for Twitter, a social media platform where users post messages called "tweets".

 $Tweet[userID] \subseteq User[userID]$

 $Follows[a] \subseteq User[userID]$

 $Follows[b] \subseteq User[userID]$

 $Likes[who] \subseteq User[userID]$

 $Likes[what] \subseteq Tweet[tweetID]$

Consider this relational schema for Twitter data. Keys are underlined.

As this question considers relational algebra, assume all relations are sets containing no nulls.

User(<u>userID</u>, name, email)

A Twitter user.

Tweet(tweetID, userID, content, date)

The user with userID made a tweet con-

taining content on date.

Follows(a, b)

User a follows user b on Twitter, which

means that

a has subscribed to b's tweets.

Likes(who, what, when, stars)

User who liked tweet what on date when.

Rating is recorded in stars.

Part (a) [2 MARKS]

Does the scheme enforce this constraint: a user cannot like the same tweet twice? Circle one:

Yes No.

If yes, explain; if not write a new constraint to enforce it. You cannot change any of the existing constraints, rather write a new constraint to enforce it:

Part (b) [2 MARKS]

Does the scheme enforce this constraint: You can only follow someone who has a tweet you like. Circle one:

Yes No.

If yes, explain; if not write a new constraint to enforce it:

Part (c) [2 MARKS]

Suppose relation *User* has 100 tuples. How many tuples could *Follows* have? Circle all that apply:

0 1 100 10,000 100,000

Student #:

Part (d) [4 MARKS]

Which of the following pairs of queries are equivalent? Circle each pair that returns the same results on all database instances.

- 1. $\Pi_{userID}(Tweet \bowtie User) = \Pi_{userID}(Tweet)$
- 2. $User = User \bowtie User$
- 3. $\Pi_{name}(User) = \Pi_{name}(User \bowtie_{userID=who} Likes)$
- 4. $\Pi_{when}(Likes) \cap \rho_{date \to when} \Pi_{date}(Tweet) = \Pi_{when}(Tweet \bowtie_{when=date} Likes)$

Part (e) [2 MARKS]

Which of the following queries can be expressed using the same form of relational algebra that we used in class and on Assignment 1, meaning: assignment, and the operators $\Pi, \sigma, \bowtie, \bowtie_{condition}, \times, \cap, \cup, -, \rho$? Circle all that apply.

- 1. Find the oldest Tweet(s). This means the Tweet(s) whose date is the oldest in the database instance.
- 2. Find all tweets that no one has liked.
- 3. Find all people who only like their own tweets.
- 4. Find people who have made the most tweets. If there is a tie, report them all.
- 5. The trust relation is defined as follows. If a follows b, then a trusts b. In addition, if b follows c and a trusts b then a trusts c. Find all users who the user 'Colonel Chris Hadfield' trusts.

Question 2. [8 MARKS]

Here is the schema from Assignment 1. A few attributes and relations have been omitted for simplicity.

Relations

 ${\bf Product}(\underline{{\bf DIN}},\,{\bf manufacturer},\,{\bf name},\,{\bf form},\,{\bf schedule})$

A tuple in this relation represents a drug product.

Price(DIN, price)

The price of a drug product.

Prescription(RxID, date, patient, drug, doctor)

A prescription for *drug* was written on *date* for *patient* by *doctor*. Attribute *patient* is the patient's OHIP number.

Filled(RxID, date, pharmacist)

Prescription RxID was filled by pharmacist on date.

Attribute *pharmacist* is the pharmacist's OCP number.

Integrity constraints

 $Price[DIN] \subseteq Product[DIN]$

 $Prescription[drug] \subseteq Product[DIN]$

 $Filled[RxID] \subseteq Prescription[RxID]$

 $\Pi_{\text{schedule}} \text{Product} \subseteq$

{"prescription", "narcotic", "OTC"}

Let's say a pharmacist has exhaustive experience if, for all drug products in the database, he or she has filled a prescription for it. Report the OCP number of every pharmacist with exhaustive experience.

Use only the basic operators $\Pi, \sigma, \bowtie, \times, \cap, \cup, -, \rho$, and assignment.

Continue your answer here if more space is needed.

Student #: Page 5 of 9 CONT'D...

Follows:

a

drizzy | 61 | 2016-10-18|

potus | 33 | 2016-09-11|

b

User:

userid |

Question 3. [6 MARKS]

Suppose we have implemented the Twitter schema from Question 1 in SQL, and the tables currently contain the following:

email

adele Adele Laurie : drizzy Drake potus Barack Obama rjm Renee Miller	Blue Adkins potus@gov.us rjm@cs		potus drizz drizz adele	zy rjm zy adele	
Tweet: tweetid userid con	•	Likes: who	what	•	stars
15 adele Hel		drizzy	+ 15	2016-10-16	*

Show the output of each of the following queries.

28 | rjm

61 | adele | It's me | 2016-10-16

33 | potus | 6 weeks | 2016-10-11

| in the 6 | 2016-10-10

name

SELECT who SELECT userID, count(a)
FROM Likes, Tweet FROM User, Follows
WHERE userID = 'adele'; WHERE userID = b
GROUP BY userID;

SELECT count(*) AS num1, count(email) AS num2 SELECT userID
FROM User; FROM User NATURAL JOIN Tweet;

SELECT tweetID, what FROM Tweet FULL JOIN Likes ON date = when;

FROM Tweet)
 EXCEPT
(SELECT when as date
FROM Likes);

(SELECT date

Question 4. [4 MARKS]

Write a query to find the name of everyone with at least 2 followers each of whom (meaning each of these followers) has made at least one tweet. Ensure that your query would work on any instance of the database, not simply the one above.

[Use the space below for rough work. This page will not be marked unless you clearly indicate the part of your work that you want us to mark.]
